Statistical learning

Random Variables

- A random variable is some aspect of the world about which we (may) have uncertainty
 - R = Is it raining?
 - T = Is it hot or cold?
 - D = How long will it take to drive to work?
 - L = Where is the ghost?
- We denote random variables with capital letters
- Random variables have domains
 - R in {true, false}
 - T in {hot, cold}
 - D in $[0, \infty)$
 - L in possible locations, maybe {(0,0), (0,1), ...}

Probability Distributions

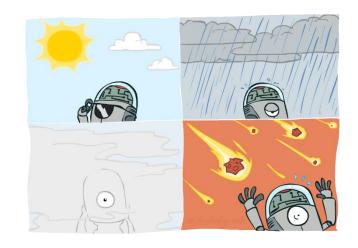

Associate a probability with each value

Temperature:

P(T)T P
hot 0.5
cold 0.5

Weather:

 $\frac{P(W)}{W}$

W	Р
sun	0.6
rain	0.1
fog	0.3
meteor	0.0

Probability Distributions

Unobserved random variables have distributions

P(T)	
Т	Р
hot	0.5
cold	0.5

D/m

- (<i>(' ')</i>	
W	Р
sun	0.6
rain	0.1
fog	0.3
meteor	0.0

P(W)

- A distribution is a TABLE of probabilities of values
- A probability (lower case value) is a single number

$$P(W = rain) = 0.1$$

• Must have:
$$\forall x \ P(X=x) \ge 0$$
 and $\sum_x P(X=x) = 1$

Shorthand notation:

$$P(hot) = P(T = hot),$$

 $P(cold) = P(T = cold),$
 $P(rain) = P(W = rain),$
...

OK if all domain entries are unique

Joint Distributions

• A *joint distribution* over a set of random variables: $X_1, X_2, ... X_n$ specifies a real number for each assignment (or *outcome*):

$$P(X_1 = x_1, X_2 = x_2, \dots X_n = x_n)$$

 $P(x_1, x_2, \dots x_n)$

• Must obey:
$$P(x_1, x_2, \dots x_n) \ge 0$$

$$\sum_{(x_1, x_2, \dots x_n)} P(x_1, x_2, \dots x_n) = 1$$

P(T, W)

Т	W	Р
hot	sun	0.4
hot	rain	0.1
cold	sun	0.2
cold	rain	0.3

- Size of distribution if n variables with domain sizes d?
 - For all but the smallest distributions, impractical to write out!

Probabilistic Models

- A probabilistic model is a joint distribution over a set of random variables
- Probabilistic models:
 - (Random) variables with domains
 - Assignments are called *outcomes*
 - Joint distributions: say whether assignments (outcomes) are likely
 - Normalized: sum to 1.0
 - Ideally: only certain variables directly interact
- Constraint satisfaction problems:
 - Variables with domains
 - Constraints: state whether assignments are possible
 - Ideally: only certain variables directly interact

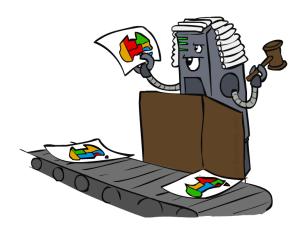

Distribution over T,W

Т	W	Р
hot	sun	0.4
hot	rain	0.1
cold	sun	0.2
cold	rain	0.3

Constraint over T,W

Т	W	Р
hot	sun	Т
hot	rain	F
cold	sun	F
cold	rain	Т

Events

An event is a set E of outcomes

$$P(E) = \sum_{(x_1...x_n)\in E} P(x_1...x_n)$$

- From a joint distribution, we can calculate the probability of any event
 - Probability that it's hot AND sunny?
 - Probability that it's hot?
 - Probability that it's hot OR sunny?
- Typically, the events we care about are partial assignments, like P(T=hot)

P(T,W)

Т	W	Р
hot	sun	0.4
hot	rain	0.1
cold	sun	0.2
cold	rain	0.3

Quiz: Events

■ P(+x, +y)?

■ P(-y OR +x)?

P(X,Y)

X	Υ	Р
+x	+y	0.2
+x	-y	0.3
-X	+ y	0.4
-X	- y	0.1

Marginal Distributions

- Marginal distributions are sub-tables which eliminate variables
- Marginalization (summing out): Combine collapsed rows by adding

\boldsymbol{p}	T	7	\mathbf{W}	1
1	(<u> </u>	,	VV	ノ

Т	W	Р
hot	sun	0.4
hot	rain	0.1
cold	sun	0.2
cold	rain	0.3

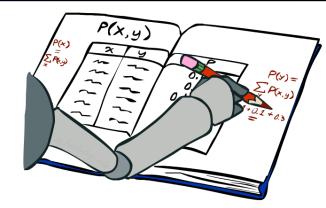

$$P(t) = \sum_{s} P(t, s)$$

$$P(s) = \sum_{t} P(t, s)$$

Т	Р
hot	0.5
cold	0.5

P(W)

W	Р
sun	0.6
rain	0.4

$$P(X_1 = x_1) = \sum_{x_2} P(X_1 = x_1, X_2 = x_2)$$

Quiz: Marginal Distributions

P(X,Y)

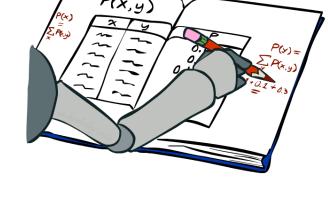

X	Υ	Р
+x	+y	0.2
+x	-y	0.3
-X	+y	0.4
-X	-у	0.1

$$P(x) = \sum_{y} P(x, y)$$

$$P(y) = \sum_{x} P(x, y)$$

P(X)

X	Р
+x	
-X	

D	1	1	7	1
1	Ţ	1		J

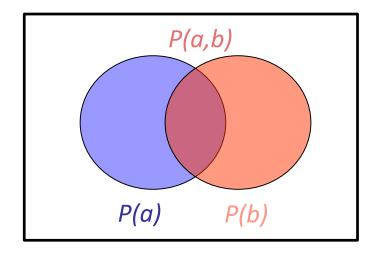

Y	Р
+y	
-y	

Conditional Probabilities

- A simple relation between joint and conditional probabilities
 - In fact, this is taken as the definition of a conditional probability

$$P(a|b) = \frac{P(a,b)}{P(b)}$$

Т	W	Р
hot	sun	0.4
hot	rain	0.1
cold	sun	0.2
cold	rain	0.3

$$P(W = s | T = c) = \frac{P(W = s, T = c)}{P(T = c)} = \frac{0.2}{0.5} = 0.4$$

$$= P(W = s, T = c) + P(W = r, T = c)$$

$$= 0.2 + 0.3 = 0.5$$

Quiz: Conditional Probabilities

■ P(+x | +y)?

P(X,Y)

X	Υ	Р
+x	+y	0.2
+x	-y	0.3
-X	+y	0.4
-X	-y	0.1

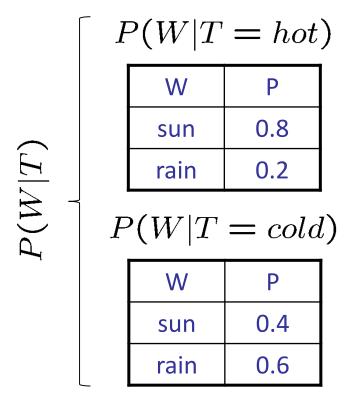

■ P(-x | +y)?

■ P(-y | +x)?

Conditional Distributions

 Conditional distributions are probability distributions over some variables given fixed values of others

Conditional Distributions

Joint Distribution

P(T, W)

Т	W	Р
hot	sun	0.4
hot	rain	0.1
cold	sun	0.2
cold	rain	0.3

Normalization Trick

P(T,W)

Т	W	Р
hot	sun	0.4
hot	rain	0.1
cold	sun	0.2
cold	rain	0.3

$$P(W = s | T = c) = \frac{P(W = s, T = c)}{P(T = c)}$$

$$= \frac{P(W = s, T = c)}{P(W = s, T = c) + P(W = r, T = c)}$$

$$= \frac{0.2}{0.2 + 0.3} = 0.4$$

$$P(W = r|T = c) = \frac{P(W = r, T = c)}{P(T = c)}$$

$$= \frac{P(W = r, T = c)}{P(W = s, T = c) + P(W = r, T = c)}$$

$$= \frac{0.3}{0.2 + 0.3} = 0.6$$

W	Р
sun	0.4
rain	0.6

Normalization Trick

$$P(W = s | T = c) = \frac{P(W = s, T = c)}{P(T = c)}$$

$$= \frac{P(W = s, T = c)}{P(W = s, T = c) + P(W = r, T = c)}$$

$$= \frac{0.2}{0.2 + 0.3} = 0.4$$

P(T,W)

Т	W	Р
hot	sun	0.4
hot	rain	0.1
cold	sun	0.2
cold	rain	0.3

SELECT the joint probabilities matching the evidence

P(c,W)

Т	W	Р
cold	sun	0.2
cold	rain	0.3

NORMALIZE the selection (make it sum to one)

$$P(W|T=c)$$

W	Р
sun	0.4
rain	0.6

$$P(W = r | T = c) = \frac{P(W = r, T = c)}{P(T = c)}$$

$$= \frac{P(W = r, T = c)}{P(W = s, T = c) + P(W = r, T = c)}$$

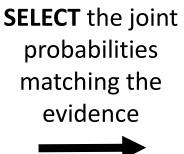

$$= \frac{0.3}{0.2 + 0.3} = 0.6$$

Normalization Trick

Т	W	Р
hot	sun	0.4
hot	rain	0.1
cold	sun	0.2
cold	rain	0.3

evidence

selection P(c, W)

Т	V	Р
cold	sun	0.2
cold	rain	0.3

NORMALIZE the (make it sum to one)

I (VV I - C)	P(W	T	=	c)
----------------	-----	---	---	----

W	Р
sun	0.4
rain	0.6

Why does this work? Sum of selection is P(evidence)! (P(T=c), here)

$$P(x_1|x_2) = \frac{P(x_1, x_2)}{P(x_2)} = \frac{P(x_1, x_2)}{\sum_{x_1} P(x_1, x_2)}$$

Quiz: Normalization Trick

■ P(X | Y=-y)?

D	(\mathbf{V})	V
I	$(\Lambda,$	I

X	Υ	Р
+x	+y	0.2
+x	-y	0.3
-X	+y	0.4
-X	-у	0.1

select the joint probabilities matching the evidence

NORMALIZE the selection (make it sum to one)

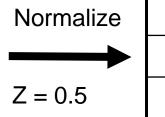

To Normalize

(Dictionary) To bring or restore to a normal condition

All entries sum to ONE

- Procedure:
 - Step 1: Compute Z = sum over all entries
 - Step 2: Divide every entry by Z
- Example 1

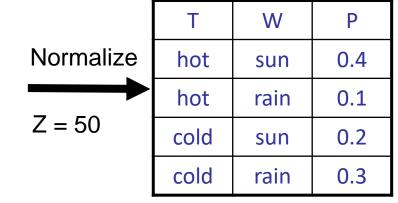

W	Р
sun	0.2
rain	0.3

W	Р
sun	0.4
rain	0.6

Example 2

Т	W	Р
hot	sun	20
hot	rain	5
cold	sun	10
cold	rain	15

Probabilistic Inference

- Probabilistic inference: compute a desired probability from other known probabilities (e.g. conditional from joint)
- We generally compute conditional probabilities
 - P(on time | no reported accidents) = 0.90
 - These represent the agent's *beliefs* given the evidence
- Probabilities change with new evidence:
 - P(on time | no accidents, 5 a.m.) = 0.95
 - P(on time | no accidents, 5 a.m., raining) = 0.80
 - Observing new evidence causes beliefs to be updated

Inference by Enumeration

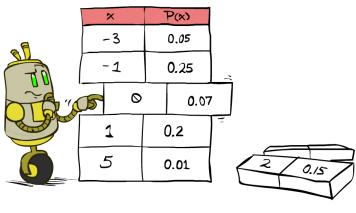

General case:

 $E_1 \dots E_k = e_1 \dots e_k$ $X_1, X_2, \dots X_n$ $All \ variables$ Evidence variables: Query* variable: Hidden variables:

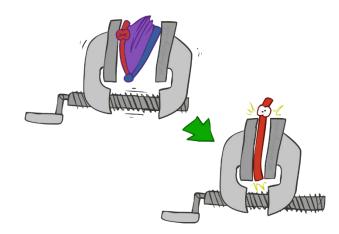

variables, too $P(Q|e_1 \dots e_k)$

We want:

Step 1: Select the entries consistent with the evidence

Step 2: Sum out H to get joint of Query and evidence

$$P(Q, e_1 \dots e_k) = \sum_{h_1 \dots h_r} P(Q, h_1 \dots h_r, e_1 \dots e_k)$$

$$X_1, X_2, \dots X_n$$

Step 3: Normalize

$$\times \frac{1}{Z}$$

* Works fine with

multiple query

$$Z = \sum_{q} P(Q, e_1 \cdots e_k)$$
$$P(Q|e_1 \cdots e_k) = \frac{1}{Z} P(Q, e_1 \cdots e_k)$$

$$P(Q|e_1\cdots e_k) = \frac{1}{Z}P(Q,e_1\cdots e_k)$$

Inference by Enumeration

■ P(W)?

P(W | winter)?

P(W | winter, hot)?

S	Т	W	Р
summer	hot	sun	0.30
summer	hot	rain	0.05
summer	cold	sun	0.10
summer	cold	rain	0.05
winter	hot	sun	0.10
winter	hot	rain	0.05
winter	cold	sun	0.15
winter	cold	rain	0.20

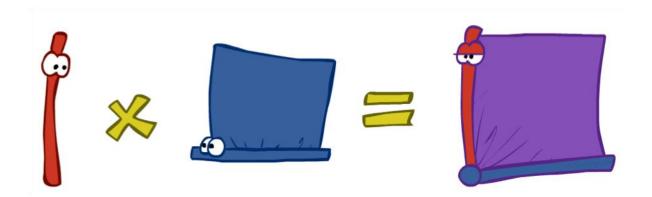

Inference by Enumeration

- Obvious problems:
 - Worst-case time complexity O(dⁿ)
 - Space complexity O(dⁿ) to store the joint distribution

The Product Rule

Sometimes have conditional distributions but want the joint

$$P(y)P(x|y) = P(x,y) \qquad \Leftrightarrow \qquad P(x|y) = \frac{P(x,y)}{P(y)}$$

The Product Rule

$$P(y)P(x|y) = P(x,y)$$

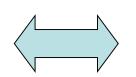

Example:

P(W)

R	Р
sun	0.8
rain	0.2

P(D|W)

D	W	Р
wet	sun	0.1
dry	sun	0.9
wet	rain	0.7
dry	rain	0.3

P(D,W)

D	W	Р
wet	sun	
dry	sun	
wet	rain	
dry	rain	

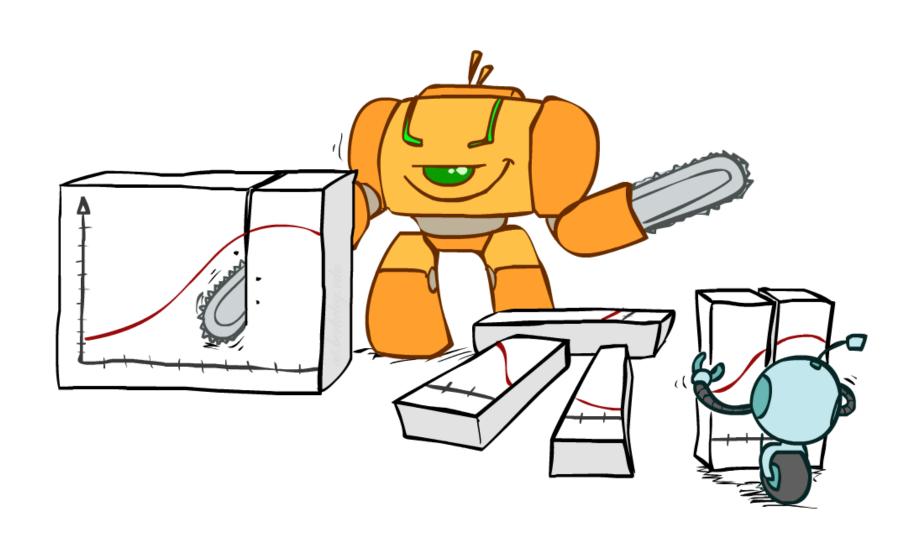

The Chain Rule

 More generally, can always write any joint distribution as an incremental product of conditional distributions

$$P(x_1, x_2, x_3) = P(x_1)P(x_2|x_1)P(x_3|x_1, x_2)$$
$$P(x_1, x_2, \dots x_n) = \prod_i P(x_i|x_1 \dots x_{i-1})$$

Why is this always true?

Bayes Rule

Bayes' Rule

Two ways to factor a joint distribution over two variables:

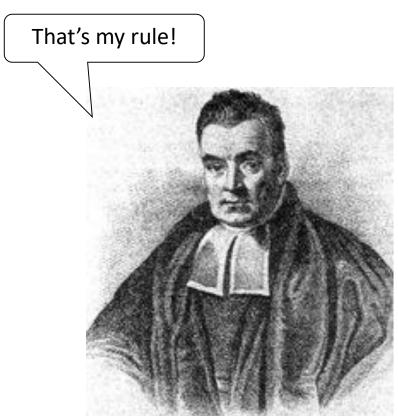

$$P(x,y) = P(x|y)P(y) = P(y|x)P(x)$$

Dividing, we get:

$$P(x|y) = \frac{P(y|x)}{P(y)}P(x)$$

- Why is this at all helpful?
 - Lets us build one conditional from its reverse
 - Often one conditional is tricky but the other one is simple
 - Foundation of many systems we'll see later (e.g. ASR, MT)

In the running for most important AI equation!

Inference with Bayes' Rule

Example: Diagnostic probability from causal probability:

$$P(\text{cause}|\text{effect}) = \frac{P(\text{effect}|\text{cause})P(\text{cause})}{P(\text{effect})}$$

- Example:
 - M: meningitis, S: stiff neck

$$P(+m) = 0.0001$$

$$P(+s|+m) = 0.8$$
 Example givens
$$P(+s|-m) = 0.01$$

$$P(+m|+s) = \frac{P(+s|+m)P(+m)}{P(+s)} = \frac{P(+s|+m)P(+m)}{P(+s|+m)P(+m) + P(+s|-m)P(-m)} = \frac{0.8 \times 0.0001}{0.8 \times 0.0001 + 0.01 \times 0.999}$$

- Note: posterior probability of meningitis still very small
- Note: you should still get stiff necks checked out! Why?

Inference with Bayes' Rule

$$P(\text{cause}|\text{effect}) = \frac{P(\text{effect}|\text{cause})P(\text{cause})}{P(\text{effect})}$$

Example:

- I am 90% confident that I'm a good singer. P(good singer) = 0.9
- If I'm a good singer, then 99% of people will like my singing. P(like | good singer) = 0.99
- If I'm a bad singer, then 10% of people will like my singing. P(like | bad singer) = 0.10
- I sing in my living room and my roommate covers his ears.
- I need to update my beliefs to account for what I've learned.
- I need to calculate: P(good singer | roommate doesn't like my singing) = ?

Quiz: Bayes' Rule

Given:

P(W)

R	Р
sun	0.8
rain	0.2

P(D|W)

D	W	Р
wet	sun	0.1
dry	sun	0.9
wet	rain	0.7
dry	rain	0.3

What is P(W | dry)?

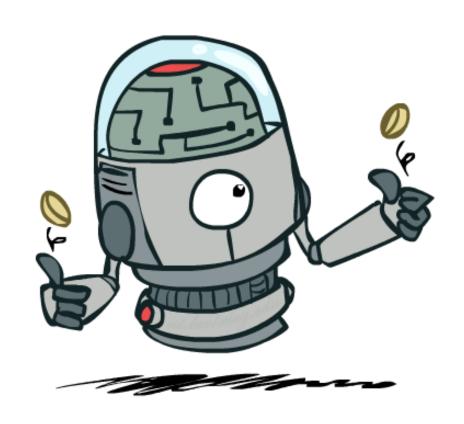

Probabilistic Models

- Models describe how (a portion of) the world works
- Models are always simplifications
 - May not account for every variable
 - May not account for all interactions between variables
 - "All models are wrong; but some are useful."
 - George E. P. Box

- What do we do with probabilistic models?
 - We (or our agents) need to reason about unknown variables, given evidence
 - Example: explanation (diagnostic reasoning)
 - Example: prediction (causal reasoning)
 - Example: value of information

Independence

Independence

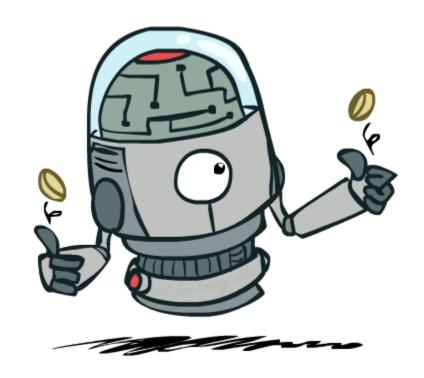

Two variables are independent if:

$$\forall x, y : P(x, y) = P(x)P(y)$$

- This says that their joint distribution factors into a product two simpler distributions
- Another form:

$$\forall x, y : P(x|y) = P(x)$$

- lacktriangle We write: $X \parallel Y$
- Independence is a simplifying modeling assumption
 - Empirical joint distributions: at best "close" to independent
 - What could we assume for {Weather, Traffic, Cavity, Toothache}?

Example: Independence?

D_{\cdot}	T	TAZ
I	(I,	VV

Т	W	Р
hot	sun	0.4
hot	rain	0.1
cold	sun	0.2
cold	rain	0.3

P(T)

Т	Р
hot	0.5
cold	0.5

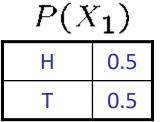

W	Р
sun	0.6
rain	0.4

$P_2(T,W)$

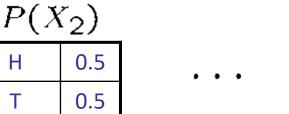

Т	W	Р
hot	sun	0.3
hot	rain	0.2
cold	sun	0.3
cold	rain	0.2

Example: Independence

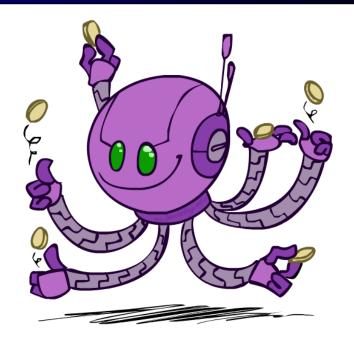

N fair, independent coin flips:

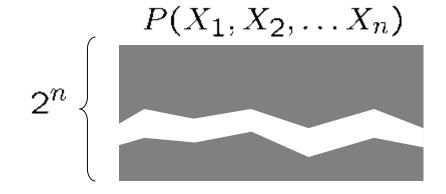

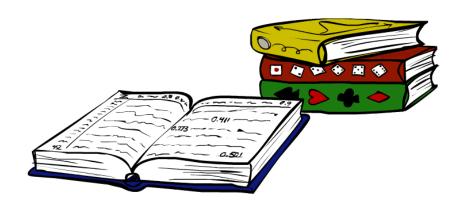

$P(\Lambda_2)$	
Н	0.5
Т	0.5

$$egin{array}{c|c} P(X_n) & & \\ \hline H & 0.5 \\ \hline T & 0.5 \\ \hline \end{array}$$

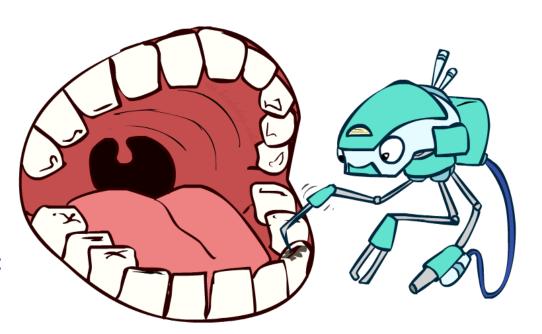

- P(Toothache, Cavity, Catch)
- If I have a cavity, the probability that the probe catches in it doesn't depend on whether I have a toothache:
 - P(+catch | +toothache, +cavity) = P(+catch | +cavity)
- The same independence holds if I don't have a cavity:
 - P(+catch | +toothache, -cavity) = P(+catch | -cavity)
- Catch is conditionally independent of Toothache given Cavity:
 - P(Catch | Toothache, Cavity) = P(Catch | Cavity)

- P(Toothache | Catch , Cavity) = P(Toothache | Cavity)
- P(Toothache, Catch | Cavity) = P(Toothache | Cavity) P(Catch | Cavity)
- One can be derived from the other easily

- Unconditional (absolute) independence very rare (why?)
- Conditional independence is our most basic and robust form of knowledge about uncertain environments.
- X is conditionally independent of Y given Z

$$X \perp \!\!\! \perp Y | Z$$

if and only if:

$$\forall x, y, z : P(x, y|z) = P(x|z)P(y|z)$$

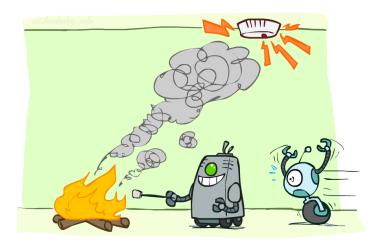

or, equivalently, if and only if

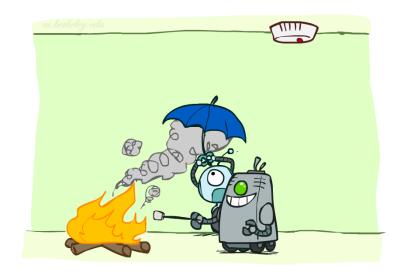

$$\forall x, y, z : P(x|z, y) = P(x|z)$$

- What about this domain:
 - Traffic
 - Umbrella
 - Raining

- What about this domain:
 - Fire
 - Smoke
 - Alarm

Conditional Independence and the Chain Rule

- Chain rule: $P(X_1, X_2, ... X_n) = P(X_1)P(X_2|X_1)P(X_3|X_1, X_2)...$
- Trivial decomposition:

$$P(\text{Traffic}, \text{Rain}, \text{Umbrella}) = P(\text{Rain})P(\text{Traffic}|\text{Rain})P(\text{Umbrella}|\text{Rain}, \text{Traffic})$$

With assumption of conditional independence:

$$P(\text{Traffic}, \text{Rain}, \text{Umbrella}) =$$

 $P(\text{Rain})P(\text{Traffic}|\text{Rain})P(\text{Umbrella}|\text{Rain})$
